Phone-hunter API

P R O G R A M M I N G H E R O

Programming Hero
@programminghero

Try this

```
fetch('https://openapi.programming-hero.com/api/phones?search=iphone')  
  .then(response => response.json())  
  .then(json => console.log(json))
```

```
Object { status: true, data: (15) [...] }
```

What is it

Phone-hunter API is being created by programming hero so that **you** can practice **API related tasks** and **get some fake data**.

Programming Hero
@programminghero

Purpose

- Getting all of the phone information by searching any phone name. For 4 types of phone you will get information: **samsung, iphone, huawei, oppo.**
- Getting the detail information for a single phone. For example: **apple-iphone-13-pro-max**

Phone search

- URL format:

[https://openapi.programming-hero.com/api/phones?search=\\${searchText}](https://openapi.programming-hero.com/api/phones?search=${searchText})

- Example:

<https://openapi.programming-hero.com/api/phones?search=iphone>

Single phone detail

- URL format:

[https://openapi.programming-hero.com/api/phone/\\${id}](https://openapi.programming-hero.com/api/phone/${id})

- Example:

https://openapi.programming-hero.com/api/phone/apple_iphone_13_pro_max-11089

Search result for

https://openapi.programming-hero.com/api/phone/apple_iphone_13_pro_max-11089

```
{
  "status": true,

    }
  }
}
```

Phone id

Programming Hero
@programminghero

Our objective using the API

- Accessing property of nested object
- Loading some data using array slice
(example: total output:50, getting 10 data from 50)
- Loading rest results after clicking more button
- Error handling on search
(example: empty search)
(example: wrong search)
- Spinner on loading
- Handling missing property using optional chaining
- Showing use of ternary operator (optional)
- Getting details of a phone using modal on button click

Let's Practice
